Seminar

Title : High-dimensional model selection via Chebyshev's greedy algorithm

Speaker : Prof. Chien-Tong Lin (林建同 助理教授)
(Department of Statistics, Feng Chia University)

Time : 10:30 ~ 12:00, Monday, March 25, 2024

Place : Auditorium, B1F, Institute of Statistical Science

Abstract

Assuming sparsity on the regression coefficient is fundamental to ultra-high dimensional variable selection. However, the true sparsity of practical data is typically uncertain, making it necessary to devise a variable selection technique that performs well under various sparsity settings. In this talk, we investigate the convergence rate of Chebyshev's greedy algorithm (CGA) for regression models when the true coefficient vector satisfies a general weak sparsity condition. We determine the iteration number of CGA using our developed data-driven approach and demonstrate that the optimal convergence rate can be achieved even when the actual sparsity level is unknown. Our convergence theory relies on the convexity and the smoothness of the population loss function, allowing for the analysis of a broad family of regression models and providing optimality guarantees under weak assumptions. As a specific example, we apply our method to generalized linear models (GLM) and composite quantile regression (CQR) models, and offer the sufficient conditions under which the optimal rate can be achieved. Thorough simulation studies as well as data analysis are provided to support the obtained theory.

※ The tea reception will be held at 10:10.

※ Lecture in English. Online live streaming through Cisco Webex will be available.
